Q1. What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy?

```

```

```
[1] 92.80919
```

- 92.81% of structures in the PDB are solved by X-ray and Electron Microscopy.

Q2. What proportion of structures in the PDB are protein?

```
(171221 / (171221 + 10444 + 10876 + 4025 + 191 + 22))*100
```

```
[1] 87.01183
```

- 87.01% structures are protein.

Q3. Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

- 4,703 structures.

The important role of water

Q4. Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

- Because hydrogen atoms are so small, we are not able to see them in the structure.

Q5. There is a critical “conserved” water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have?

- HOH 308

Now you should be able to produce an image similar or even superior to Figure 2 and save it to an image file.

Q6. Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain (we recommend “Ball & Stick” for these side-chains). Add this figure to your Quarto document.

Introduction to Bio3D in R

Bio3D is an R package for structural bioinformatics. To use it we need to call it up with `library()`

```
library(bio3d)
```

To read a PDB file we can use `read.pdb()`

```
pdb <- read.pdb("1hsg")
```

Note: Accessing on-line PDB file

pdb

```
Call: read.pdb(file = "1hsg")
```

Q7: How many amino acid residues are there in this pdb object?

- 198

Q8: Name one of the two non-protein residues?

- HOH

Q9: How many protein chains are in this structure?
